ABSTRACT OF THE DISCLOSURE

In order to offer the greatest possible flexibility in the configuration of
5   privacy management, a recording in a database (112) is associated with
each user. This database is addressed by a user identifier (IDU). It
enables the definition of a isolating identifier nature (113.b) that has to be
produced, by a service provider, for the user as a function of a content
provider to which the user wishes to link up through the service provider.
10 This database also enables the validation of the service requests sent by a
content provider for a user X. This database enables an association
between a pair formed by a user and a content provider and a list (113.c) of
authorized services. A service request is validated only if the required
service is present in a list determined from the pair consisting of the user X
15 and the content provider.
